The Aether Portal Landing Page

Design Implementation Challenge — Out of this World UI

Concept

The challenge is to design and build a single-page, high-impact landing interface for a proprietary AI system called “Aether.” The experience must be mesmerizing, highly dynamic, and guide the user clearly toward the primary actions (Login / Signup). Visual spectacle should be achieved while maintaining restraint and clarity around the Call-to-Action (CTA).

Problem statement

Create a single-screen landing interface that communicates futuristic technology and polish. The hero should be dominant with a clear CTA; include 1–2 secondary supporting sections such as Features or Testimonials. Focus on component organization, subtle spectacle, and user guidance.

Requirements & Constraints

Below is a concise table of the requirement categories and details.

Category	Details
Core Concept	Build a single-page landing interface with a primary hero section, prominent Call-to-Action (CTA), and 1–2 supporting sections (e.g., Features, Testimonials). The experience should feel futuristic and intuitive.
Visual Polish (50% weight)	Incorporate at least two of the following to create a premium, futuristic feel: • Seamless video or animated background (subtle, looping) or complex CSS animation (particle effects). • Lottie JSON animation used as hero accent or glowing logo. • High-impact transitions / micro-animations (Framer Motion, GSAP, or custom CSS) for reveals and hover states.
Code Quality (30% weight)	Component-based architecture is mandatory (React, Vue, or similar). Use a robust styling approach (e.g., Tailwind CSS, Styled-Components). Emphasize clean component separation and reusability.
Innovation (20% weight)	Show a distinctive layout (e.g., asymmetry, corner navigation, “dark matter” mode with holographic accents), creative typography, and novel content presentation.
Cleanliness	Design must remain minimalist: generous negative space, opacity/blur to separate animation from content, crystal-clear hierarchy.

Deliverables

1. A single-page implementation hosted in a GitHub repository (source code + assets).
2. A Loom video (5–7 minutes) explaining design choices, component structure, and implementation details for animations/visual elements.

Submission Reminders

- Include a public GitHub link to the full implementation.
- Include a Loom video walking through the design and technical choices.
- Deadline: **12 hours after the challenge starts** (the challenge window begins between 6:00 PM Friday and 6:00 AM Saturday).

Challenge Marking Guide (Summary)

Solutions will be evaluated across three criteria:

Correctness (50%) Strict adherence to the problem description and the listed requirements.

Code Quality (30%) Readability, maintainability, and reasonable optimization.

Innovation & Creativity (20%) Originality of approach and UI/UX decisions.

Tips for participants

- Keep the hero uncluttered: animation should highlight, not compete with the CTA.
- Prefer vector animations (Lottie) or GPU-accelerated CSS animations for performance.
- Use component-driven design with clearly separated presentation and logic layers.
- Provide a short README in the repo describing how to run the project locally and any external assets or licenses.
